# Stepping Motor Driver SD-2H086MB

**TWO PHASE MICROSTEP DRIVER****SD-2H086MB****PWM CURRENT CONTROL****1. Introduction, Features and Applications****Introduction**

The SD-2H086MB is an economical micro step driver. It is suitable for driving 2-phase 4-phase hybrid stepping motors. By using the advanced bipolar constant-current chopping technique, it can output more speed and torque from the same motor, compared with traditional drivers, such as L/R drivers. Its 3-state current control technology allows coil currents to be well controlled and with relatively small current ripple, therefore less motor heating is achieved.

**Features**

|                                       |   |
|---------------------------------------|---|
| ◆ Low cost and good high-speed torque | ◆ 14 selectable resolutions                     |
| ◆ Supply voltage up to +80VDC         | ◆ Suitable for 2-phase and 4-phase motors       |
| ◆ Output current up to 5.86A          | ◆ Dip switch current setting 8 different values |
| ◆ Optically isolated input signals    | ◆ Pulse frequency up to 200KHz                  |
| ◆ Automatic idle-current reduction    | ◆ Small size (151*107*48), Weight: 1KG          |

**2. Pin Assignment and Description**

The SD-2H086MB has two connectors, P1 for control signals connections, and connector P2 for power and motor connections. The following tables are brief descriptions of the two connectors of the SD-2H086MB. More Detailed descriptions of the pins and related issues are presented in section 7, 8, 9.

**Connector P1 Configurations**

| Pin Function | Details   |
|--------------|---|
| PUL +, PUL-  | Pulse signal: In single pulse (pulse/direction) mode, this input represents pulse signal, effective for each rising or falling edge; 4-5V when PUL-HIGH, 0-0.5V when PUL-LOW. For reliable response, pulse width should be longer than 5μs. Series connect resistors for current limiting when +12V or +24V used. |
| DIR+, DIR-   | DIR signal: In pulse mode, this signal has low/high voltage levels, representing two directions of motor rotation; For reliable motion response, DIR signal should be ahead of PUL signal by 5μs at least. 4-5V when DIR-HIGH, 0-0.5V when DIR-LOW.   |
| ENA+         | Enable signal: This signal is used for enabling/disabling the driver. High level for enabling the driver and low level for disabling the driver.  |
| ENA-         | Usually left unconnected (enabled)  |

**Connector P2 Configurations**

| Pin Function | Details  |
|--------------|--|
| GND          | DC power ground  |
| +V           | DC power supply, 20-80VDC, Including voltage fluctuation and EMF voltage |
| A+, A-       | Motor Phase A  |
| B+, B-       | Motor Phase B  |

### 3. Specifications and Operating Environment

#### Electrical Specifications (T<sub>j</sub>=25°C)

| Parameters            | SD-2H086MB |         |           |      |
|-----------------------|------------|---------|-----------|------|
|                       | Min        | Typical | Max       | Unit |
| Output current        | 1.29       | -       | 5.86(RMS) | A    |
| Supply voltage((DC)   | 20         | 68      | 80        | VDC  |
| Logic signal current  | 6          | 10      | 30        | mA   |
| Pulse input frequency | 0          | -       | 200       | KHz  |
| Isolation resistance  | 500        |         |           | MΩ   |

#### 4. Operating Environment and other Specifications

| Cooling               | Natural Cooling or Forced cooling |   |
|-----------------------|-----------------------------------|---|
| Operating Environment | Environment                       | Avoid dust, oil fog and corrosive gases |
|                       | Ambient Temperature               | 0°C-50°C                                |
|                       | Humidity                          | 40%RH-90%RH                             |
|                       | Operating Temperature             | 70°C Max                                |
|                       | Vibration                         | 5.9m/s <sup>2</sup> Max                 |
| Storage Temperature   | -20°C-65°C                        |   |
| Weight                | Approx 1000 gram(35.4oz)          |   |

#### 5. Applications

Suitable for a wide range of stepping motors from Nema size to ,It can be used in various kinds of machines ,such as tables ,labeling machines ,laser cutters, engraving machines, pick-place devices ,and so on .Particularly adapt to the applications desired with low vibration, high speed and high precision.

#### 6. Selecting Supply Voltage

The power MOSEFTS inside the SD-2H086MB can actually operate within 20V—+80VDC,including power input fluctuation and back EMF voltage generated by motor coils during motor shaft deceleration. Higher supply voltage can increase motor torque at higher speeds ,thus helpful for avoiding losing steps. However, higher voltage may cause bigger motor vibration at lower speed ,and it may also cause over-voltage protection or even driver damage . Therefore, it is suggested to choose only sufficiently high supply voltage for intended applications, and it is suggested go use power supplies with theoretical output voltage of +20V~+80V,leaving room for power fluctuation and back-EMF.

#### 7. Selecting Micro step Resolution and Driver Output Current

This driver uses an 8-bit DIP switch to set microstep resolution, and motor operating current, as shown below:

## 7.1 Microstep Resolution Selection

Microstep resolution is set by SW 5,6,7,8 of the DIP switch as shown in the following table:

| Steps/rev.(for 1.8°motor) | SW5 | SW6 | SW7 | SW8 |
|---------------------------|-----|-----|-----|-----|
| 400                       | On  | On  | On  | On  |
| 500                       | off | On  | On  | On  |
| 600                       | On  | Off | On  | On  |
| 800                       | Off | Off | On  | On  |
| 1000                      | On  | On  | Off | On  |
| 1200                      | Off | On  | Off | On  |
| 1600                      | On  | Off | Off | On  |
| 2000                      | Off | Off | Off | On  |
| 2400                      | On  | On  | On  | Off |
| 3200                      | Off | On  | On  | Off |
| 4000                      | On  | Off | On  | Off |
| 5000                      | Off | Off | On  | Off |
| 6000                      | On  | On  | Off | Off |
| 6400                      | Off | On  | Off | Off |
| 8000                      | On  | Off | Off | Off |
| 10000                     | Off | Off | Off | Off |

## 7.2 Current Settings

For a given motor, higher driver current will make the motor to output more torque, but at the same time causes more heating in the motor and driver .Therefore, output current is generally set to be such that the motor will not overheat for long time operation .Since parallel and serial connections of motor coils will significantly change resulting inductance and resistance, it is therefore important to set driver output current rating supplied by motor phase and connection methods. Phase current rating supplied by motor manufacturer is important in selecting driver current ,however the selection also depends on leads and connections.

The first three bits (SW 1,2,3)of the DIP switch are used to set the dynamic current. Select a setting Closest to your motor's required current

### Dynamic Current Setting

| RMS current (A) | SW1 | SW2 | SW3 |
|-----------------|-----|-----|-----|
| 1.29A           | Off | Off | Off |
| 1.93A           | On  | Off | Off |
| 2.57A           | Off | On  | Off |
| 3.29A           | On  | On  | Off |
| 3.93A           | Off | Off | On  |
| 4.57A           | On  | Off | On  |
| 5.27A           | Off | On  | On  |
| 5.86A           | On  | On  | On  |

Notes: Due to motor inductance, the actual current in the coil may be smaller than the dynamic current setting, particularly under high speed condition..

### 7.3 Standstill Current Setting

SW4 is used for this purpose. OFF meaning that the standstill current is set to be half of the selected dynamic current, and ON meaning that standstill is set to be the same as the selected dynamic current. The current automatically reduced to 60% of the selected dynamic current 0.4 second after the last pulse. Theoretically, this will reduce motor heating to 36% (due to  $P=I^2 \cdot R$ ) of the original value. If the application needs a different standstill current, please contact SUNRISE MOTOR.

### 8. Wiring Notes

- ◆ In order to improve anti-interference performance of the driver, it is recommended to use twisted pair shield cable.
- ◆ Prevent noise incurred in PUL/DIR signal, pulse/direction signal wires and motor wires should not be tied up together. It is better to separate them by at least 10 cm, otherwise the disturbing signals generated by motor will easily disturb pulse direction signals, causing motor position error, system instability and other failures.
- ◆ If a power supply serves several drivers, separately connecting the drivers is recommended instead of daisy-chaining.
- ◆ It is prohibited to pull and plug connector P2 while the driver is powered ON. Because there is high current flowing through motor coils (even when motor is at standstill). Pulling or plugging connector P2 with power on will cause extremely high back-EMF voltage surge, which may damage the driver.

### 9. Sequence Chart of Control Signals

In order to avoid some fault operations and deviations. PUL, DIR and ENA signals must abide by some rules, as shown in the following diagram (assuming J1 default setting is upward-rising edge effective):

WIDTH OF PULSE A  $\geq 2.5 \mu\text{s}$ ; WIDTH OF PULSE B  $\geq 2.5 \mu\text{s}$ ; PULSE FREQUENCY  $\leq 200\text{kHz}$ ,

TIME OF CHANGE DIR  $\geq 2 \mu\text{s}$ ; INPUT SIGNAL  $V_i$   $3.6\text{V} \leq \text{H LEVEL} \leq 5.5\text{V}$ ;  $-5.5\text{V} \leq \text{L LEVEL} \leq 0.3\text{V}$

Figure1: Sequence chart of control signals

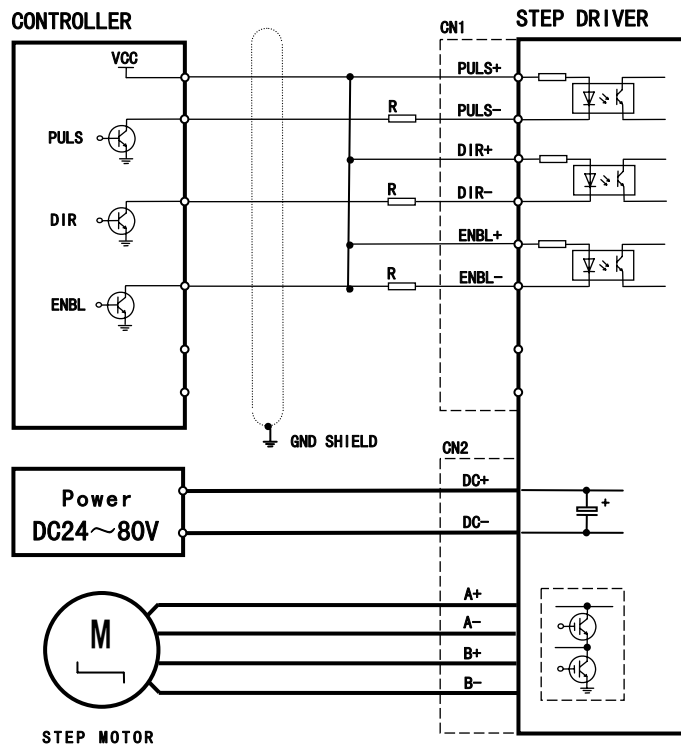

### 10. Control Signal Connector(p1) Interface

The SD-2H086MB can accept differential and single-ended input signals (including open-collector and PNP output). The SD-2H086MB has 3 optically logic inputs which are located on connector P1 to accept line driver control signals. These inputs are isolated to minimize electrical noises coupled onto the drive control

signals. Recommend use line driver control signals to increase noise immunity of the driver in interference environments. In the following figures, connections to open-collector and PNP signals are illustrated.

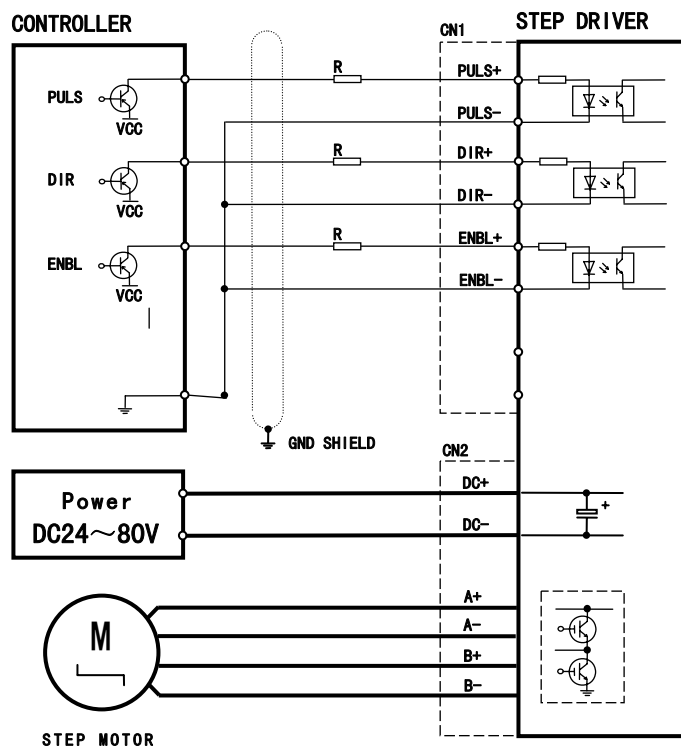

Figure2 . NPN C-E OPEN PULSE SIGNALS CONNECTION:

ATTENTION:

- When  $VCC = +5V$ ,  $R$  is short circuit, equal  $0\Omega$ ;  $RA$  select  $470\Omega$ .
- When  $VCC = +12V$ ,  $R$  and  $RA$  select  $1k\Omega/0.25W$ .
- When  $VCC = +12V$ ,  $R$  and  $RA$  select  $2k\Omega/0.25W$ .
- Cable from controller to driver need shield, shield with ground or controller connect to GND.
- Choose diameter of power line and motor line, not less than  $1mm^2$ .

Figure3 . PNP C-E OPEN PULSE SIGNALS CONNECTION:

ATTENTION:

- When  $VCC = +5V$ ,  $R$  is short circuit, equal  $0\Omega$ ;  $RA$  select  $470\Omega$ .
- When  $VCC = +12V$ ,  $R$  and  $RA$  select  $1k\Omega/0.25W$ .
- When  $VCC = +12V$ ,  $R$  and  $RA$  select  $2k\Omega/0.25W$ .
- Cable from controller to driver need shield, shield with ground or controller connect to GND.
- Choose diameter of power line and motor line, not less than  $1mm^2$ .

Figure4 . line driver control signals:

## ATTENTION:

- When  $VCC = +5V$ , R is short circuit, equal  $0\Omega$ ; RA select  $470\Omega$ .
- When  $VCC = +12V$ , R and RA select  $1k\Omega/0.25W$ .
- When  $VCC = +12V$ , R and RA select  $2k\Omega/0.25W$ .
- Cable from controller to driver need shield, shield with ground or controller connect to GND.
- Choose diameter of power line and motor line, not less than  $1mm^2$ .

## 11. Mechanical Specifications (unit:mm, 1 inch=25.4)

Figure 5: Mechanical specifications

\*Recommended to use side mounting better heat dissipation

## 12.Connecting the Motor

The SD-2H086MB driver can drive any 2-phase and 4-phase hybrid stepping motors.

### Connections to 4-leads Motors

4 leads motors are the least flexible but easiest to wire. Speed and torque will depend on winding inductance. In setting the driver output current, multiply the specified current by 1.4 to determine the peak output current.

Figure6: 4-leads motor connections

### Connections to 6-leads Motors

Like 8 leads stepping motors ,6 leads motors have two configurations as available for high speed or high torque operation. The higher speed configuration, or half coil ,is so described because it uses one half of the motor's inductor windings. The higher torque configuration, or full coil., uses the full windings of the phases.

#### Half coil Configurations

As previously stated, the half coil configuration uses 50% of the motor phase windings. This gives lower inductance, hence lower torque.. Like the parallel connection of 8 leads motor, the torque output will be more stable at higher speeds. This configuration is also referred to as half chopper. In setting the driver output current multiply the specified per phase(or unipolar)current rating by 1.4 to determine the peak output current.

Figure 7:6-leads motor half coil (higher speed)connections

## Full Coil Configurations

The full coil configuration on a six lead motor should be used in applications where higher torque at lower speeds is required. This configuration is also referred to as full copper. In full coil mode, the motor should be run at only 70% of their rated current to prevent over heating.

Figure8:6-leads motor full coil (higher torque) connections

## Connections to 8-leads Motors

8 leads motors offer a high degree of flexibility to the system designer in that may be connected in series or parallel, thus satisfying a wide range of applications.

### Series Connections

A Series motor configuration would typically be used in applications where a higher torque at lower speeds is required. Because this configuration has the most inductance, the performance will start to degrade an higher speeds. In series mode, the motors should also be run at only 70% of their rated current to prevent over heating.

Figure 9:8-leads motor connections

### Parallel Connections

An 8 leads motor in a parallel configuration offers a more stale. But lower torque at lower speeds. But because of the lower inductance, there will be higher torque at higher speeds. Multiply the per phase (or unipolar)current rating by 1.96,or the bipolar current by 1.4,to determine the peak output current.

Figure 10:8-leads motor parallel connections

### 13. Power Supply Selection

The SD-2H086MB can match medium and small size stepping motors (from Nema size 17 to 34) made by SUNRISE MOTOR or other motor manufactures around the world. To achieve good driving performances, it is important to select supply voltage and output current properly. Generally speaking, supply voltage determines the high speed performance of the motor, while output current determines the output torque of the driven motor (particularly at lower speed). Higher supply voltage will allow higher motor speed to be achieved, at the price of more noise and heating. If the motion speed requirement is low, it's better to use lower supply voltage to decrease noise, heating and improve reliability.

#### Regulated or Unregulated Power Supply

In figure 11:

TX1 is transformer,  $V_{DC+} \approx 1.414 \times V_{out}$ . power of transformer based on current of load. C1 is , example : 100V/2200uF; C2 example: 400V/0.22 uF; D1 based on current of load or output supply voltage

Both regulated and unregulated power supplies can be used to supply the driver. However, unregulated power supplies are preferred due to their ability to withstand current surge. If regulated power supplies (such as most switching supplies.) are indeed used, it is important to have large current output rating to avoid problems like current clamp, for example using 4A supply for 3A motor-driver operation. On the other hand, if unregulated supply is used, one may use a power supply of lower current rating than that of motor (typically 50%~70% of motor current). The reason is that the driver draws current from the power supply capacitor of the unregulated supply only during the ON duration of the PWM cycle, but not during the OFF duration. Therefore, the average current withdrawn from power supply is considerably less than motor current. For example, two 3A motors can be well supplied by one power supply of 4A rating.

#### Multiple Drivers

It is recommended to have multiple drivers to share one power supply to reduce cost, if the supply has enough capacity. To avoid cross interference, DO NOT daisy-chain the power supply input pins of the drivers. (Instead, please connect them to power supply separately.)

### 14. Protection Functions

To improve reliability, the driver incorporates some built-in protections features.

#### 15. Over-voltage Protection

When power supply voltage exceeds +45VDC, protection will be activated and power indicator LED will turn red.

## **Coil-ground Short Circuit Protection**

Protection will be activated in case of short circuit between motor coil and ground.

**Attention:** Since there is no protection against power leads(+,-)reversal, it is critical to make sure that power supply leads correctly connected to the driver .Otherwise, the driver will be damaged instantly. When power supply voltage is lower than +20VDC,the driver will not works properly.

## **16.Ferquently Asked Questions**

In the event that your SD-2H086MB doesn't operate properly, the first is to identify whether the problem is electrical or mechanical in nature. The next step is to isolate the system component that is causing the problem. As part of this process you may have to disconnect the individual document each step in the troubleshooting process. You may need this documentation to refer back to at a later date, and these details will greatly assist our Technical Support staff in determining the problem should you need assistance.

Many of the problems that affect motion control systems can be traced to electrical noise, controller software errors, or mistake in wiring.

## **17.APPENDIX**

### **Twelve Months Limited Warranty**

SUNRISE MOTOR warrants its products against defects in materials and workmanship for a period of 12 months from shipment out of factory. During the warranty period, Sunrise Motor will either ,at its option, repair or replace products which proved to be defective.

### **Exclusions**

The above warranty does not extend to any product damaged by reasons of improper or inadequate handlings by customer ,improper or inadequate customer wirings ,unauthorized modification or misuse .or operation beyond the electrical specifications of the product and/or operation beyond environmental specifications for the product.

### **Obtaining Warranty Service**

To obtain warranty service, a returned material authorization number(RMA)must be obtained from customer service at e-mail:sunrisemotor@126.com before returning product for service. Customer shall prepay shipping charges for products returned to Sunrise Motor for warranty service, and Sunrise Motor shall pay for return of products to customer.

### **Warranty Limitations**

Sunrise Motor makes no other warranty ,either expressed or implied, with respect to the product. Sunrise Motor specifically disclaims the implied warranties of merchantability and fitness for a particular purpose. Some jurisdictions do not allow limitations on how long and implied warranty lasts .so the above limitation or exclusion may to apply to you, However, any implied warranty of merchantability or fitness is limited to the 12-monthes duration of this written warranty.
